

sani nudge

Understand and optimize workflow

With Sani nudge workflow insights

Use the workflow insight application to measure workflow trends and identify how much staff is needed during the day, week and month. Ensure patients receive the visits they need and optimize resources to avoid staff burnout.

ENSURE VISIT QUALITY

The time nurses spend with patients should be balanced to the need. Ensure that the patient received the visits required at the right time and by the right people.

LOWER INFECTION RATES

Nurses that are less stressed are able to generate better patient outcomes and **reduce** infection rates. Reduced infection rates leads to less readmission, decrease length of stay, and greater reimbursement to the **hospitals**.

27% BURNOUTS

Job burnout among nurses is about 27%, due to the intense nature of occupational duties. Interestingly, the insufficient number of nurses and the resulting high workload is the first source of exhaustion.

WORKFLOW INSIGHTS

With the activity indicator you can know if departments are staffed with too few or too many nurses on a given day during certain periods of the day and use that information to better predict staffing needs.

BENEFITS

- Measure staff activity level
- Ensure on-time nurse routing
- Understand patient visit duration

UNIQUE FEATURES

- Automated nurse rounding log
- Staff stress indicator
- Patient visit duration
